ABSTRACT

2

3 A container body with a container opening and a flap partially secured to the
4 container body and completely covering the container opening is disclosed. The flap is
5 secured to the container by a hinge or fold line and formed from the same substrate as the
6 container body. The container body contains a first magnetic region adjacent to and
7 surrounding the perimeter of the container opening. The flap contains a second magnetic
8 region aligned with and opposite the container body's first magnetic region. The first and
9 second magnetic regions are magnetically attracted to each other. The flap is held in a
10 closed position by magnetic attraction between the flap's magnetic region and the
11 container body's magnetic region.
